

Manufacturer's Fire Rating Statement

This statement is intended to provide our client with general information about the general fire rating of Parasoleil's laser-cut aluminum panels. Parasoleil reserves the right to modify this attestation at any time.

Parasoleil is a manufacturer of aluminum laser-cut decorative panels. These panels are generally designed based on customers' specifications and produced in various powder coat finishes. Parasoleil panels are used as applied decorative applications only and are not installed as part of any structural or fire protection system or assembly, or as part of a building envelope or rain screen. The inherent laser cut perforations are consistent across the panels and range in opening percentage from 25% to 50% open so do not in any way form concealed spaces or shafts in conjunction with other building materials or components.

The raw material for Parasoleil panels is 5052 aluminum alloys, which is procured from domestic and foreign producers in open-market purchases. Parasoleil does not offer a product certificate for fire rating, however, because the panels are made of 100% aluminum with known physical properties, they are considered non-combustible.
